

Pentaxl website — what is on each page, and what we still need from you

Grey boxes on purpose. This sheet is about *structure* — what sits where, in what order, and what each block is for — so you can mark up layout and content without the colours and motion getting in the way. Every block has a reference code; quote it and we will know exactly what you mean.

PREPARED FOR	SITE	PAGES	STATUS

Needs your input

How the pages connect

Five items in the top navigation. Everything else is reached from the footer or from links inside a page — nothing is a dead end.

```
/ Home – routes people to the right place
  – /services index
    |   – /services/[slug] × 5 – one per discipline
  – /work index
    |   – /work/[slug] × 2 – case studies
  – /stack technology, filterable
  – /about who we are, how to engage
    |   – /process five delivery stages
  – /contact form + direct details
  – /privacy, /terms footer only
  – 404, 500 designed, with a route back
```

1. Home

Home's job is to route people, not to say everything. Ten blocks, top to bottom.

Home /

A visitor should learn what we do, see proof it is real, and find one obvious next step — inside about fifteen seconds.

1.1

Sticky header

Logo, five nav items, and a thin progress line showing how far down the page you are. On phones the nav collapses into a bottom sheet with the main action in thumb reach.

Sticky

Mobile drawer

1.2

Hero

Headline, one supporting sentence, two actions at different commitment levels (“Start a project” and “See our work”), and three counters — 10 engineers, 5 disciplines, 6 technology clusters.

The five-point figure is the name made literal: each point is one discipline and a working link into that page. It redraws itself line by line on every visit.

Draws on load

Points are links

Tagline to confirm

1.3

Technology strip

A slow-moving line of the tools we work in. Cheap credibility for a technical buyer scanning for something familiar.

1.4

Services — five tabs

One tab per discipline. Hovering or selecting lights the tab and swaps the panel below: what it is, the numbered list of what you actually receive, a typical timeline with an honest caveat, and the tools involved.

Keeps five services on the page without five walls of text.

1.5

Selected work — carousel

Swipeable on touch, arrows and dots on desktop. Two cards for High Flyers and Mon Amour, then a third inviting the reader's own project, since client work is confidential.

Nothing moves on its own — the reader stays in control.

1.6

How we work — five stages

Numbered because it genuinely is a sequence. Each stage shows roughly how long it takes and what lands at the end of it. Scrolls sideways on a phone rather than shrinking to five unreadable columns.

1.7

What we build with — six clusters

Languages, frameworks, AI and ML, cloud, data, security. A glow follows the cursor across each card. Links to the full list where every tool says what it is used for.

Cursor glow

Confirm the inventory

1.8

Questions buyers ask

Six answers we would give on a first call: how engagements start, what happens when scope changes, on-premise deployment, existing codebases, adding AI to a live product, and team size. Opening one closes the last.

Doubles as search-engine content, so these answers can win the search itself.

Accordion

Add or cut questions

2.1 Services index

Closing invitation

Services </services>

Explains why the five disciplines are sold together, then lets the reader pick one.

2.1

Five cards, two columns

Each card: an icon, the name, one sentence a non-technical buyer understands, the typical timeline and how many deliverables it includes. A hairline draws itself in as the card appears.

Cursor glow

3. Service detail

One per discipline [/services/\[slug\]](/services/[slug])

Five pages, same five-part shape, so a buyer can compare them. Each is individually findable in search.

3.1

Numbered sections

What it is, in plain English. What you actually receive, as things you can open or run. How long it typically takes, with the caveat stated. Which technologies are involved — pulled from the same source as the stack page, so the two can never disagree.

Breadcrumbs at the top, previous and next service at the bottom, so the page never dead-ends.

[Prev](#) / [next](#)

4. Work index

Work </work>

Two products, honestly labelled as our own rather than implied client engagements.

4.1

Two cards, plus a note

Both currently say the write-up is in progress, which is deliberate — an empty section is recoverable, invented detail is not. A line underneath explains that client engagements are covered by confidentiality and discussed in a call.

Write-ups needed

5. Case study

One per project [/work/\[slug\]](/work/[slug])

A fixed seven-part shape, so two case studies can be compared at a glance.

Home / Work / ...

01 Context 02 Problem

03 Approach – each decision with its trade-off

04 Architecture – one diagram

05 Stack 06 Outcome 07 What we would do differently

5.1

The seven parts

Context, problem, approach with trade-offs named, one architecture diagram, outcome, stack, and — unusually — what we would do differently. That last section is the one that makes an engineer trust the rest.

While a write-up is unfinished the page says so plainly and stays out of search results.

Both awaiting content

6. Stack

Technology ecosystem [/stack](#)

Six clusters, each entry saying what we use it for. This is the page that wins specific searches.

6.1

Filter, then a two-column list

Pills across the top filter to one cluster; they light up on hover and scroll sideways on a phone. Every row is a tool and the reason it was chosen — not a logo wall.

Filter pills

Prune to what is true

7. Process

How an engagement runs [/process](#)

Five stages, with scope agreed in writing at stage three — before anyone builds.

7.1

Stage by stage

Each stage states what happens, what you do, what lands, and roughly how long. A closing section says out loud what happens when scope changes mid-build — most firms leave that deliberately vague, and saying it is a differentiator.

8. About

About </about>

Why the firm exists, how to engage it, and who the client would actually work with.

Approach

Engagements – fixed scope / retainer / augmentation

Team

8.1

The gap worth closing

Three engagement shapes are described plainly. The team section currently says ten engineers and where you are based, with a visible note that names are being added — a consultancy page with no named people is the thing a buyer notices, and it is the single highest-value addition left.

Names, roles, links

9. Contact

Start a project </contact>

A real page at a real address — linkable from an email signature or a proposal, unlike a pop-up.

Name

Email

Phone – optional

What do you need – select

Budget range – optional

What are you trying to build

Email

Phone

WhatsApp

9.1

Form, plus the details directly

Six fields, with the service pre-selected so enquiries arrive qualified. Mistakes are caught when you leave a field, never while typing, and nothing you typed is lost if something fails. Spam is handled by a hidden field and a per-visitor limit.

Email, phone and WhatsApp are shown next to the form, because some people will never use a form.

Live validation

Mailbox not yet live

Budget bands

10. Legal and error pages

SUPPORTING PAGES			
Ref	Page	What it contains	Status
10.1	Privacy — /privacy	What the form collects, why, how long it is kept, and your rights. States plainly that the site sets no cookies and runs no third-party analytics.	Needs a legal read
10.2	Terms — /terms	Covers the website only. Says explicitly that nothing on the site is a quote and that work begins when scope and price are agreed in writing.	Needs a legal read
10.3	Page not found — 404	Designed, not a default. Explains the likely cause and lists the main sections as a way out.	Done
10.4	Something broke — 500	Designed. Offers “Try again”, a link home, and an email address.	Done

A. What we need from you

Everything below is marked in the build and checked automatically before launch, so none of it can ship by accident. Nothing here blocks reviewing the site.

OPEN ITEMS

Ref	Item	On the site today	What we need
A1	Company mailbox	A stand-in address. The form deliberately tells people it is not delivering yet rather than dropping enquiries silently.	A real mailbox on the domain. Then the form goes live in one change.
A2	Phone and WhatsApp	Hidden — nothing broken, the rows simply do not appear.	One number. It then shows on Contact and in the footer automatically.
A3	Tagline	“Software, AI and cloud, from idea to production.”	Confirm or replace. It appears in the footer, page titles and link previews.
A4	City shown publicly	Country only.	The city you want shown, if any.
A5	Named people	“Ten engineers” and a visible note that names are being added.	Two or three names, roles and links. Highest-value item on this list.
A6	Two case studies	Both marked in progress and kept out of search.	For each: the constraint, what was hard, two or three decisions with their trade-offs, the outcome, and what you would do differently.
A7	Service list	Five disciplines.	Confirm each is genuinely sold today. We delete rather than keep anything aspirational.
A8	Technology inventory	A sensible default set across six clusters.	Prune anything you do not actually work in — an overstated stack fails in the first technical call.
A9	Budget bands	Four ranges in dollars, plus “not decided yet”.	Confirm currency and bands. Wrong bands filter out good enquiries.

Ref	Item	On the site today	What we need
A10	Privacy and terms	Accurate descriptions of what the site does.	A legal review before launch.

B. Add-ons we can build

Deliberately not built yet, either because they need something only you can supply or because they are a separate decision.

OPTIONS			
Ref	Add-on	What it needs from you	Worth it when
B1	Client logos and quotes	Written permission to publish each name, and a real attributed quote.	You have two or three referenceable clients. Unverifiable logos actively cost you trust, which is why there are none today.
B2	Team page with photos	Names, roles, short bios, headshots.	Alongside A5 — the strongest single credibility addition.
B3	Insights or blog	A commitment to publish, even quarterly.	You will actually write. An abandoned blog reads worse than none.
B4	Careers page	Real openings.	You are hiring. It stays out of the footer until then — never a dead link.
B5	Case study screenshots and diagrams	Images you are permitted to show.	With A6. Shots of real software outperform any amount of copy.
B6	Booking link	A calendar account.	You would rather take calls than emails; sits beside the form.
B7	Second language	Translated copy.	You sell outside English-speaking markets. The content layer is already structured for it.
B8	Analytics	A decision on privacy posture.	You want traffic numbers. A cookie-free option keeps the “no cookies” promise on the privacy page intact.

C. Change requests

Quote the reference code from any block above — “1.5 — put the case studies before the services” is enough for us to act on without a call.

FOR YOUR NOTES			
Ref	Page / block	Change or addition	Priority

Print or save this page as a PDF to mark it up by hand — the layout is set up for it.
